## CLAIMS

1. A method for modifying a biopolymer to enhance endothelial cell attachment and growth comprising coating a base biopolymer with an attachment mixture containing laminin, fibronectin, RGDS, bFGF conjugated with polycarbophil and EGF conjugated with polycarbophil for a period of time sufficient for corneal endothelial cells to attach to and grow on said biopolymer.

- 2. A method of making an artificial cornea comprising:
  - a) a base biopolymer;
  - b) molding the biopolymer into a desired shape;
- c) coating the biopolymer with an attachment mixture comprising laminin, fibronectin, RGDS, bFGF conjugated with polycarbophil and EGF conjugated with polycarbophil;
- d) incubating the reagent with the biopolymer at approximately 4 °C for a sufficient period of time to improve adherence of corneal endothelial cells;
  - e) removing the attachment mixture; and
- f) seeding of corneal endothelial cells onto the biopolymer.
- 3. The method of claim 2 wherein the biopolymer is comprised of collagen IV.

4. The method of claim 2 wherein the seeding is at high density.

- 5. A method of making an artificial cornea comprising:
  - a) a base biopolymer;

·.·

- b) molding the biopolymer into a desired shape;
- c) coating the biopolymer with a BCE-ECM coating comprising the steps of:
- 1) seeding onto the biopolymer at low density, a population of bovine corneal endothelial (BCE) cells in a culture media suitable for their growth;
- 2) allowing the BCE cells to grow to confluence; and
- 3) aspirating the media and treating the biopolymer with ammonium hydroxide for a sufficient period of time to remove the cells;
  - d) washing the biopolymer with a suitable buffer; and
- e) seeding corneal endothelial cells onto the biopolymer and growing to confluence.
- 6. A method of making an artificial cornea comprising:
  - a) a base biopolymer;

b) molding the biopolymer into a desired shape;

- c) coating the biopolymer with Diamond-Like Carbon using a suitable process;
  - d) washing the biopolymer with a suitable buffer; and
- e) seeding corneal endothelial cells onto the biopolymer and growing to confluence.
- 7. A method of growing endothelial cells suitable for use in a cornea comprising:
  - a) a base biopolymer;
  - b) molding the biopolymer into a desired shape;
- c) coating the biopolymer an adhesion factor mixture comprising a sufficient quantity of laminin, fibronectin, RGDS, and collagen IV in a suitable biological buffer;
  - d) applying the biopolymer to the corneal button; and
- e) seeding corneal endothelial cells onto the biopolymer and growing to confluence.
- 8. A method of growing endothelial cells suitable for use in a cornea comprising:
- a) creating a base biopolymer in contact with an adhesion factor mixture comprising a sufficient quantity of

laminin, fibronectin, RGDS, and collagen IV in a suitable biological buffer and a growth factor mixture comprising a sufficient quantity of bFGF, EGF and polycarbophil in a suitable biological buffer;

- b) molding the biopolymer into the shape of a cornea;
- c) applying the biopolymer to the corneal button; and
- d) seeding corneal endothelial cells onto the biopolymer and growing to confluence.
- 9. An attachment mixture comprising laminin, fibronectin, RGDS, bFGF conjugated with polycarbophil and EGF conjugated with polycarbophil in sufficient concentration to allow for growth of corneal endothelial cells in vitro.
- 10. An attachment mixture comprising:
  - a) 10  $\mu$ g to 500  $\mu$ g/ml of fibronectin in PBS;
  - b) 10 μg/ml to 500 μg/ml of laminin in PBS;
  - c) 1 µg/ml to 100 µg/ml RGDS in PBS;
- d) 10  $\mu g$  to 1000  $\mu g$  of collagen type IV in 0.1 M acetic acid;
  - e) 1 ng/ml to 500 ng/ml b-FGF in PBS; and
  - f) 1 ng/ml to 500 ng/ml EGF in PBS.
- 11. An artificial full-thickness corneal transplant support comprising:
- a) a base biopolymer having a thickness of approximately an average cornea;

b) incorporating into the biopolymer during its synthesis an attachment reagent comprising one or more of the following: laminin, fibronectin, RGDS, bFGF conjugated with polycarbophil, EGF conjugated with polycarbophil, and heparin sulfate; and

- c) molding the biopolymer into a desired shape of a cornea.
- 12. The composition of claim 11 wherein the biopolymer is comprised of collagen IV.
- 13. An artificial full-thickness corneal transplant comprising:
- a) a base biopolymer having a thickness of approximately an average cornea;
- b) incorporating into the biopolymer during its synthesis an attachment reagent comprising one or more of the following: laminin, fibronectin, RGDS, bFGF conjugated with polycarbophil, EGF conjugated with polycarbophil, and heparin sulfate;
  - c) molding the biopolymer into the shape of a cornea;
- d) seeding HCEC onto the biopolymer and growing to confluence.
- 14. An artificial half-thickness corneal transplant support comprising:

 a) a base biopolymer having a thickness of approximately one half the thickness of an average cornea;

- b) incorporating into the biopolymer during its synthesis an attachment reagent comprising one or more of the following: laminin, fibronectin, RGDS, bFGF conjugated with polycarbophil, EGF conjugated with polycarbophil, and heparin sulfate; and
  - c) molding the biopolymer into the shape of a cornea.
- 15. An artificial half-thickness corneal transplant comprising:
- a) a base biopolymer having a thickness of approximately one half the thickness of an average cornea;
- b) incorporating into the biopolymer during its synthesis an attachment reagent comprising one or more of the following: laminin, fibronectin, RGDS, bFGF conjugated with polycarbophil, EGF conjugated with polycarbophil, and heparin sulfate;
  - c) molding the biopolymer into the shape of a cornea;
- d) seeding HCEC onto the biopolymer and growing to confluence.
- 16. The artificial cornea of claim 15 wherein the biopolymer is collagen IV.

17. The artificial cornea of claim 1 wherein the biopolymer is non-swelling in the presence of culture media.

- 18. A method of repairing a damaged cornea comprising the steps of:
- a) obtaining an artificial full-thickness cornea which has been seeded with HCEC and allowed to grow a sufficient period of time so that the HCEC are confluent;
- b) implanting the artificial full-thickness cornea of step a onto a damaged cornea;
  - c) securing said cornea by surgical or other means.
- 19. A method of repairing a damaged cornea comprising the steps of:
  - a) obtaining an artificial full-thickness cornea;
- b) overlaying said corneal surface with a biopolymer having confluent HCEC on it;
- c) implanting the artificial full-thickness cornea of step a onto a damaged cornea;
  - d) securing said cornea by surgical or other means.
- 20. A method of repairing a damaged cornea comprising the steps of:

a) obtaining an artificial half-thickness cornea which has been seeded with HCEC and allowed to grow a sufficient period of time so that the HCEC are confluent;

- b) implanting the artificial half-thickness cornea of step a onto a damaged cornea;
  - c) securing said cornea by surgical or other means.
- 21. A method of repairing a damaged cornea comprising the steps of:
  - a) obtaining an artificial half-thickness cornea;
- b) overlaying said corneal surface with a biopolymer having confluent HCEC on it;
- c) implanting the artificial half-thickness cornea of step a onto a damaged cornea;
  - d) securing said cornea by surgical or other means.
- 22. A method for making retinal pigment epithelial (RPE) cells suitable for transplantation into a retina comprising the steps of:
- a) obtaining a biopolymer having a top and a bottom surface and having a thickness between about 10 to 100 m in thickness;
  - b) placing said biopolymer in a medium suitable for the

growth of RPE cells in vitro;

c) seeding RPE cells onto the top surface of said biopolymer sheet at a certain density and allowing the RPE cells to grow to confluence; and

- d) removing said sheet and cutting to a desired size.
- 23. The method of claim 22 wherein the biopolymer is biodegradable.
- 24. The method of claim 22 wherein the biopolymer is embedded or has incorporated into it during its synthesis an attachment reagent comprising one or more of the following: laminin, fibronectin, RGDS, bFGF conjugated with polycarbophil, EGF conjugated with polycarbophil, and heparin sulfate.
- 25. A composition comprising retinal pigment epithelial (RPE) cells suitable for transplantation into a retina made using the method of claim 22.
- 26. A method of repairing a retina in vivo comprising the steps of:
- a) identifying the damaged area of a retina to be repaired;
- b) aspirating remaining RPE cells from the damaged retinal area;

c) obtaining retinal pigment epithelial (RPE) cells suitable for transplantation into a retina made by the method of claims 1, 2 or 3;

- d) aspirating the biopolymer with the RPE on its top side into a cannula or other suitable aspiration means;
- e) injecting an air bubble of suitable size into the damaged area of a retina to be repaired;
- f) positioning the biopolymer with the RPE on its top side onto the damaged area with the cells on its top side; and
  - g) aspirating the air bubble in the retinal space.
